SECURITY & CODE AUDIT

ONBOARDING BRIEFING · CONFIDENTIAL

Your job: Check FilsPay, a payment app made for Bahrain. It signs up shops, takes card payments, and pays the shops their money. Everything is in Bahraini Dinar (BD). 1 BD = 1000 fils.

WHAT YOU NEED TO DO

01 AUDIT
Find security holes, money bugs and anything that breaks.

02 FIX
Fix each bug with the smallest change that works.

03 EXPLAIN
For each bug, write a short note: what's wrong, why, and what it breaks.

04 BUILD
Finish the missing feature and host it on Dilmune Cloud. See the back.

THE REPO

apps/api/	TypeScript/Fastify API (auth, payments, webhooks, admin)
apps/settlement/	Go daemon (batch close, scheme export, splits, payouts)
apps/reporting/	TypeScript consumer (outbox events to rollups)
apps/web/	React hosted checkout
apps/admin/	React admin console
packages/money/	Shared integer-fils arithmetic
packages/events/	Outbox event types
db/migrations/	Postgres schema (numbered 0001 to 0072)
scripts/	One-off operational scripts
ops/	Docker compose, env files
docs/	Architecture, ADRs, runbook, handover notes

WHERE TO START

- Start with `docs/ARCHITECTURE.md` and `docs/HANDOVER.md`
- Read every ADR in `docs/adr/`. They are the rules the code should follow
- Money rule: **whole fils only, never decimals** (ADR-0001)
- Settlement closes every day at midnight, Bahrain time (UTC+3)
- Run `docker compose up` in `ops/` to start everything on your laptop

SCORING Bigger bugs get more points, and so do clear explanations. Explaining why a bug happens scores more than just spotting it. A small fix that works scores more than a big rewrite.

UNFINISHED

FINISH THE MISSING FEATURE

REQUESTED BY PRODUCT · NEVER SHIPPED

> The last developer started a feature but never finished it. Find out what it is, build it so it works from start to end, and host the app on Dilmune Cloud.

DONE WHEN

- [ ] The feature **works from start to end**, through the API
- [ ] The **money is right** in the ledger, down to the fils
- [ ] **Fees and payouts** come out right
- [ ] The shop gets the **right webhook**
- [ ] It shows up right in the **timeline**, the **reports** and **reconciliation**
- [ ] The app is **live on Dilmune Cloud**, our hosting provider

"looks easy. it isn't. it touches everything."
